Higher-Order Voronoi Diagrams on Triangulated Surfaces

Fort, Marta

We study the complexity of higher-order Voronoi diagrams on triangulated surfaces under the geodesic distance, when the sites may be polygonal domains of constant complexity. More precisely, we show that on a surface defined by n triangles the sum of the combinatorial complexities of the order-j Voronoi diagrams of m sites, for $j=1,\ldots,k$, is $O(kn^2\cdot k^m\cdot knm)$, which is asymptotically tight in the worst case.
